## 1. GENERAL WARNINGS

The rack conveyor dishwashers have been conceived and realised in conformity with the following norms:

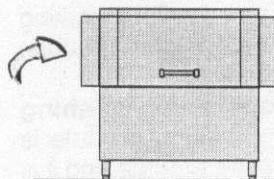

- Low Voltage Directive 73/23/CEE;
- EN 60335-1 Electric Appliances' Security;
- EN 60335-52 Particular Norms regarding dishwashers for catering.

### 1.1 USE

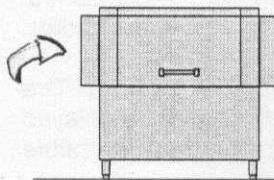

The rack conveyor dishwashers are designed to wash any type of dishes used in catering. The appliances must be used only for the functions for which they are conceived and following the described instructions for use. Any modification made without our written approval will exempt us from any responsibility and it will invalidate the guarantee.

## 2. DESCRIPTION OF THE MACHINE

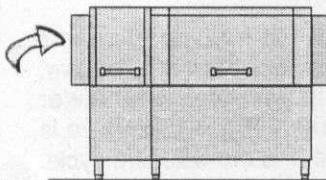

### MODELS AVAILABLE:

**Washing+rinsing  
1 speed**

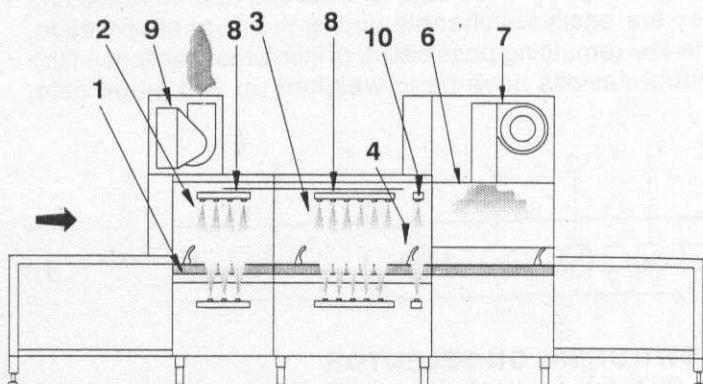

**Washing+rinsing  
2 speeds**

**Prewashing+  
washing+rinsing  
2 speeds**

Rack conveyor dishwashers have been constructed with the highest grade stainless steel AISI 304 to guarantee a longlasting length of time. They can be normally composed by a prewash unit, a wash unit, a rinse unit and a drying unit. All panels can be insulated from an acoustic point of view, on request. Racks advance through the different units by means of a conveyor bar (1). In the prewash unit (2), at a temperature of 40°/45°C, most of the dirtiness is removed from the dishes. In the wash unit (3) at a temperature of 55°/65°C the dishes are washed. In the rinse unit (10) at a temperature of 85°/90°C the dishes are rinsed. A splashguard curtain isolates the wash and rinse section. The complete range of the ETE series can be, upon request, electrically or steam heated. In the drying unit (6) a high pressure recirculatory fan (7) takes air from outside and, once heated by means of heating elements, it is flown on the dishes. When steams are passing by, the temperature of the water inside the exchanger raises up. This water will be drained outside or, on demand, it will be used to regenerate the one in the prewash tank. The wash arms (8) have

sprayers and bayonet couplings easy to remove for quick cleaning and maintenance.

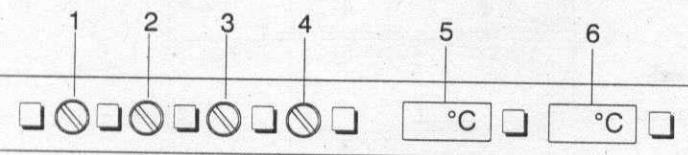

## 3. SAFETY DEVICES

- A) **Conveyor microswitch:** it intervenes when something comes between the basket and the conveyor bar obstructing the sliding and stopping all functions.
- B) **Micro stop switch:** to stop the rack when it reaches the end of the exit table. This avoids dishes from falling and breaking whenever the baskets are not immediately unloaded.
- C) **Microswitches on any door:** they stop any function of the machine and they do not allow the machine to start to operate when doors are opened.
- D) **Thermal protections for wash pumps and motors** to guarantee their integrity in case of short-circuit or overcharges.
- E) **Protections with fuses of each element** to save them from any short-circuit dangers.
- F) **Boiler safety thermostat.** In case of thermostat's breakdown, a second safety thermostat intervene to stop the heating elements' operation.
- G) Control panel fed at 24V.
- H) **Drying unit safety thermostat.** In case of break-down of the temperatures control thermostat, a second safety thermostat intervenes to avoid the overheating of the heating elements.

## 4. CONTROLS DESCRIPTION

### 4.1 CONTROL PANEL

All control systems are able to resist to a normal stress and they are easily reachable during the normal operation. The few remaining possibilities of involuntary actions of the control devices have been weighed up and made safe.

#### 1) SWITCHING ON SELECTOR

- By turning it, the tanks and boiler' filling and the boiler and tank' digital thermometers are activated.

#### 2) SPEED SELECTOR FOR BASKETS PUSHING (If fitted)

- The machine has 2 speeds. Position "1" is suggested for very dirty dishes while position "2" for normal or less dirty dishes. Turn the selector to select the speed suitable for the type of washing.

#### 3) SELECTOR FOR DRYING UNIT

- By turning it, the dryer is activated.

#### 4) WASH PUMPS SELECTOR (If fitted)

- By turning it, the electropumps' washing is activated. This operation must be carried out after the machine has been drained - it is indicated by a control lamp.

#### 5) BOILER THERMOMETER

- It displays the water temperature in the boiler.

#### 6) WASHING THERMOMETER

- It displays the water temperature in the wash tank.

## 4.2 MACHINE'S SETTING

**Tank heating element:** it is activated only when the minimum water level has been achieved (heating element completely plunged in the water). A special thermometer indicates the temperature in the tank.

**Basket stop-switch:** when the basket comes out from the machine, it reaches a micro-stop switch which stops the basket pushing. The washing cycle continues until the set time has elapsed. When the basket is unloaded, the basket pushing and the washing cycle start again.

**Door microswitch:** the doors opening during the working cycle makes the pumps stop and reset the cycle. When the door is closed, the working cycle starts again.

**Rinsing economizer:** the rinse module is activated only when the basket enters the module and it is de-activated when the basket comes out.

**Prewashing economizer (If fitted):** the prewash module is activated only when the basket enters the module and it is de-activated when the basket comes out. The working cycle starts when the basket enters the prewash module.

**Washing economizer (only for models with washing + rinsing modules):** the washing + rinsing module is activated only when the basket enters the module and it is automatically de-activated once the set time has elapsed. The working cycle starts when the basket enters the module.

**Dryer:** it is activated only by the relative selector. The switching off of the dryer's ventilator is automatically delayed in order to protect the heating elements from possible overheatings.

**Tank pressure gauge:** it protects the heating elements and pump from dry operation. If the water level is too low, the wash pump does not work. If the water level drops during the operating timing, the tank filling electrovalve is activated without stopping the pump and the washing cycle.

**Pumps washing system (If fitted):** it is activated by turning the selector "4". If the washing cycle is under way, the activation is not allowed. The activation is not allowed also when there is water in the tank, in order to avoid the polluted water to flow back in the hydraulic network. The washing pump system has a pre-set length and it is indicated by a special lamp.

## 5. REGULATIONS

### 5.1 AUTOMATIC DETERGENT DOSER (if fitted)

The detergent doser must be calibrated basing on the water's hardness, the level of dirtiness and the concentration of the detergent used. If the amount of rinsing agent is insufficient, the dishes come out dirty and not sufficiently degreased. An excessive amount of the rinsing agent causes stripes of detergent on the dishes and creates foam in the wash tank.

**Only a NO-FOAM detergent must be used, specific for dishwashers following the quantities suggested by the manufacturer in relation with the water's hardness and the tank's capacity.**

### 5.2 SURFACE-ACTIVE AGENT (if fitted)

The doser must be calibrated in relation with the hardness of the supplied water. The doser is calibrated in the correct way, when the dishes and glasses come out of the machine without droplets of water and they dry in 15-30 seconds. An excessive amount of surface-active agent causes whitish stripes on the glasses. Foam can be created if the concentration is too high or if the water's temperature is too cold.

### 5.3 CALIBRATION OF TANK-BOILER'S THERMOSTATS

Thermostats can be reached removing the lower front panel in the wash area. **The thermostats' calibration is made in the factory. The calibration must not be modified. Only a qualified and authorised technician can calibrate the thermostats.**

## 6. SAFETY PROVISIONS

- Danger of being caught or dragged on among the moving elements (i.e. conveyor bar etc.).
- Danger of thermic nature
  - on the insulated washing and rinsing doors this risk is absent.

## 7. OPERATION

### 7.1 BEFORE THE WASHING CYCLE

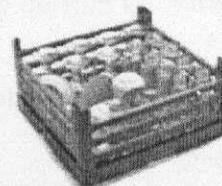

- 1) The overflow plugs must be inserted in the drain pipe and the pump and tank filters must be correctly positioned. Never use the machine without filters.
- 2) The splashguard curtains must be correctly positioned.
- 3) Close the doors.
- 4) Push the main switch on the wall.
- 5) Open the gate valve of the plumbing installation.
- 6) Check the level of the detergent and brightener's container. If the machine is not fitted with automatic detergent doser device, pour the dose of industrial no-foam detergent in each tank, taking care of the detergent concentration and of the tank capacity. Every 10 minutes of continuous working, pour 70-150 g of detergent in order to keep the right concentration.

### 7.2 WASHING CYCLE

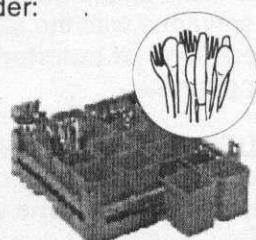

- 1) The machine can work with 2 different speeds of baskets' feeding (if fitted) and they can be selected by means of the conveyor selector (par. 4). The slow feeding must be used for very dirty dishes while for normally or less dirty

dishes use the fast one. In case of very dirty dishes it is convenient to soak them for some minutes with water and detergent before introducing them in the machine.

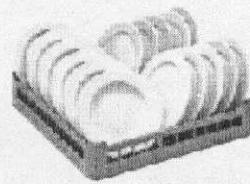

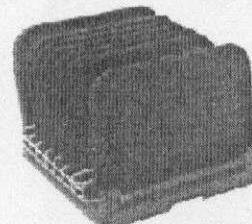

- 2) Place cups, glasses, cutlery, dishes and trays in the specific baskets as showed hereunder:

GLASSES AND CUPS  
FACING UPWARDS

HANDLE FACING  
DOWN

- 3) Push the basket from the inlet table towards the machine inlet - the washing cycle will start automatically at the module's entry, thanks to the microswitch shown in the picture. When basket is passing by, the microswitch is pushed activating the washing/rinsing conveyor' process (timer and electropump are activated) - this process will automatically stop when the basket will go far from the module involved. Thanks to this, it is possible to have an energy and water recovery.

When the washing, rinsing and drying process are finished, the basket is dragged to the machine's exit - in order to avoid the washing process to be stopped, take the basket off before it gets in touch with the micro-stop switch. Use gloves during washing.

### 7.3 AFTER THE WASH CYCLE

- 1) Switch the machine off turning the selector "1" anti-clockwise.
- 2) Turn the main switch on wall off.
- 3) Close the gate valve.
- 4) Empty the tanks by means of the appropriate devices.
- 5) Verify and make the correct cleaning of the wash filters (surface and submerged ones). Whenever the water conditions do not allow a correct hygiene (water too dirty or with too much grease) provide for a water change with additional detergent.
- 6) Check the dishes' level of cleaning.

## 8. MAINTENANCE

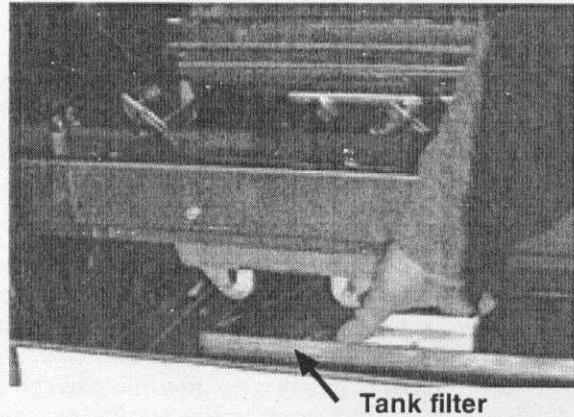

### 8.1 SAFETY PROVISIONS DURING THE MAINTENANCE

All interventions on the machine must be adequate and in strict observance with the safety norms for the operator. **The operations of maintenance must be carried out wearing gloves.**

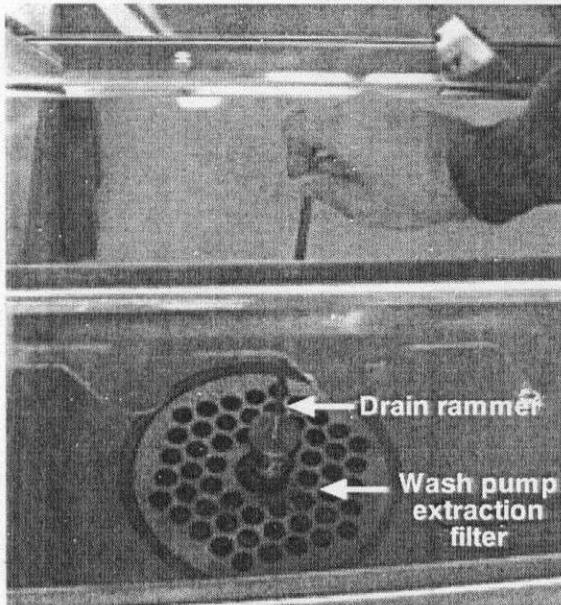

### 8.2 ROUTINE MAINTENANCE (to be made every day)

The machine must be cleaned inside:

- remove the tank filters and wash them;

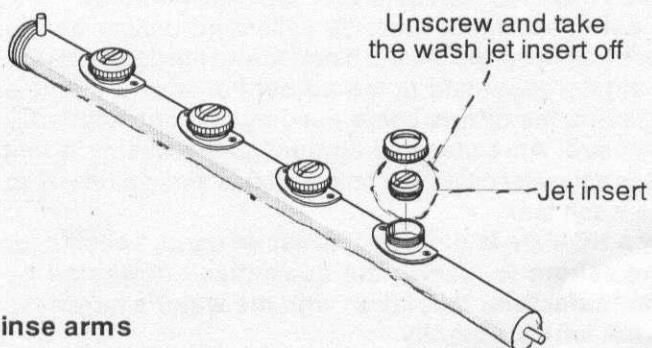

- drain the water by unplugging the overflow;
- remove the submerged filter of the wash pump and clean it;

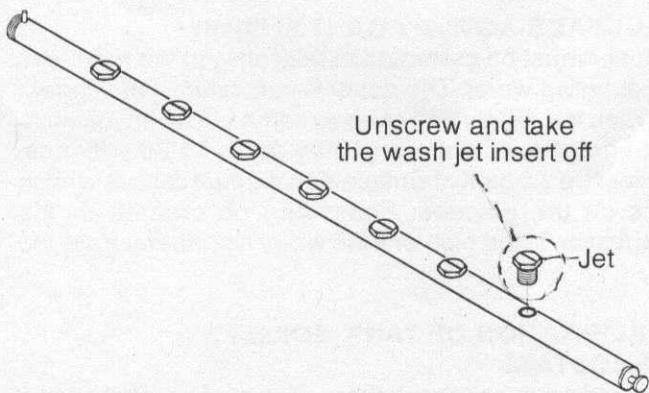

- never clean the machine with acid, corrosive, abrasive products or steel brushes;
- clean the inlet, outlet and separating' curtains with a brush;
- clean the surfaces of the appliance only when they are cold using a cloth with no foam, no acid and no abrasive products. **Never wash the appliance with direct jets of water or steam appliances;**
- make sure that the rotary wash and rinse arms are free to rotate otherwise remove the solid particles carefully. The wash arm can be easily removed thanks to the bayonet coupling. The rinse arms' nozzles can be disassembled as shown in the picture.

#### Wash arms

#### Rinse arms

- clean the inlet/outlet tables;
- when the cleaning is finished, leave the appliance doors open in order to make the internal surfaces completely dry and to avoid unpleasant smells;
- to guarantee the washing hygiene, at least once a week, sterilize the machine by using specific disinfectants, finishing with repeated empty rinsing cycles for several minutes.

**For all the cleaning operations never use products which could create foam in the machine.**

### 8.3 PERIODIC MAINTENANCE

(to be done every 2 weeks)

- Lime deposits and scale will build up due to calcium and magnesium salts present in the water. These scales and deposits can prejudice proper appliance operation. The appliance must be periodically descaled by qualified personnel.
- Check the safety devices efficiency.
- Check possible technical faults on the conveyor bar.
- Clean the steam exchanger with compressed air.

**The present operating manual is supplied with the following diagrams and drawings:**

- Installation drawing with the relevant dimensions and electrical connections;
- technical sheet;
- wiring diagram;
- sheet with noise level.

## 9. FAULTS

In case of machine's faults, address only to technical qualified personnel.

### FAULT

### PROCEDURE

---

MACHINE DOES NOT OPERATE

- Check voltage of the power supply.
- Check fuses.
- Check the transformer.
- Check the micro cut-off switch.
- Check the micro-door switch.

---

MACHINE DOES NOT FILL

- Check the pressure switch.
- Check the filling solenoid valve.

---

WASHING MOTOR DOES NOT OPERATE

- Check the water level.
- Reset thermostat.
- Check fuses.

---

MACHINE DOES NOT RINSE

- Check economy microswitch.
- Check water solenoid valve.
- Check water inlet filter.

---

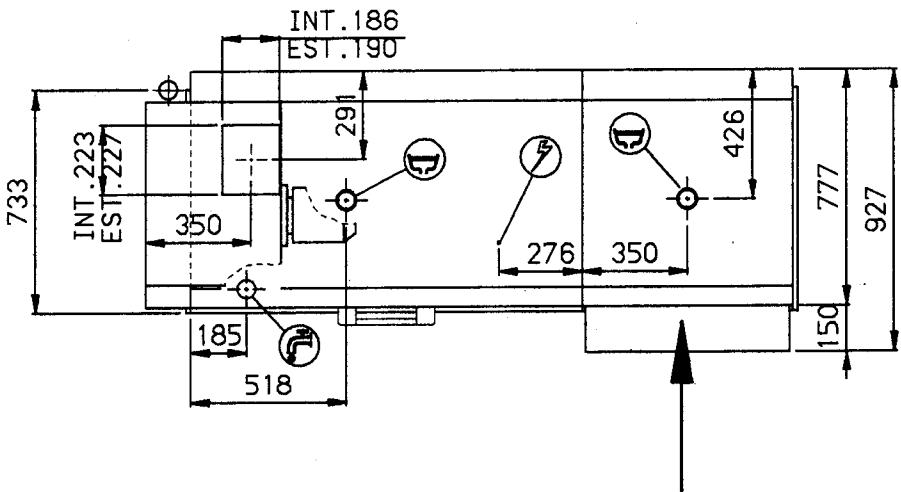

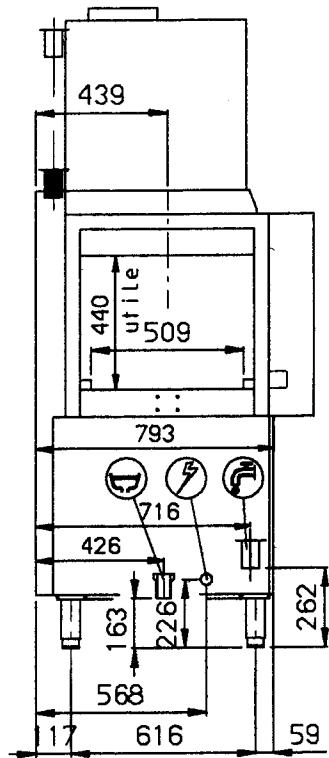

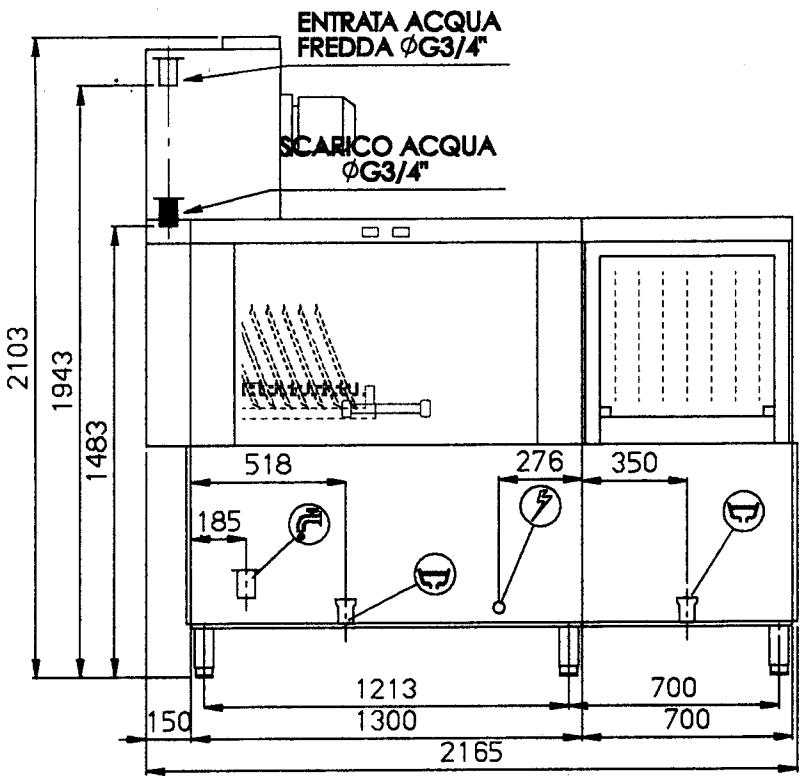

MACHINE DOES NOT HEAT

- Check contactor.
- Check fuses.
- Check thermostats.
- Check heating element.
- Check pressure switch.

---

CONVEYOR MOTOR DOES NOT OPERATE

- Check the micro cut-off switch.
- Check fuses.
- Reset thermostat.
